

This document explains how to install a wireless temperature sensor for a fridge/freezer. A wireless temperature sensor consists of the following components:

Step 1: Installing the Gateway Device

Important! The gateway device must be situated at least three feet or more away from any sensor.

- 1. Attach the antenna to the gateway device.
- 2. Connect the device to a network wall port using the Ethernet cable.
- 3. Provide power to the device using the charger block plugged into a wall outlet.
- 4. Check that the three LED lights on the front of the gateway device are green, which indicates that the device is connected to your network.

Note: The gateway device uses a dynamic IP address (DHCP). To use a static IP address, contact MealSuite Support with the following:

- Gateway ID and code (located on the bottom of the device).
- IP address you want assigned.
- Subnet mask.
- Default gateway on your network.
- DNS Server details (can use the <u>Google Public DNS</u>)

Step 2: Installing a Sensor and Probe

Important! A sensor is shipped with a label to indicate its assigned fridge/freezer. Ensure you place the sensor at its assigned fridge/freezer. In addition, a sensor must be at least three feet or more away from other sensors and the gateway device.

- 1. Unscrew the sensor case and insert the provided AA batteries.
- 2. Install the sensor on the **outside of the fridge/freezer** using the screws or double-sided tape.

3. Run the probe cord between the door and door seal. Secure the cord using the provided clips. Place the probe in a clip so that it is **not touching the wall or any object.**

Optional - Run the Probe Through a Hole Drilled in Fridge/Freezer Wall

Instead of running the probe cord between the fridge/freezer door and seal, you can run it through a hole drilled in the fridge/freezer wall. If so, drill a hole slightly larger than the width of the probe. After running the probe through the hole, use silicone caulking to seal the hole around the probe cord.

Step 3: Antenna Orientation

For the sensor to communicate optimally with its gateway device, the antenna of the sensor and the antenna of the gateway device must have the same orientation. A vertical orientation of the antennas is recommended.

Step 4: Activating a Sensor in Touch Admin

Your MealSuite temperature sensors are preconfigured to operate based on previouslyprovided preferences.

After you install a sensor, then you must set its status to "Active" in Touch Admin so that the sensor can begin to send real-time data to the MealSuite system.

- 1. In Touch admin, select HAACP HQ (under Location Setup).
- 2. Select the Fridge/Freezer Sensors tab. A list of existing sensors appears.
- 3. Select the **Paused Sensors** tab.
